

ABSTRACT

A system and method for publishing images such as 3DMovies and Virtual Tours to the Internet is disclosed. The system has a publishing server that is configured to upload image and associated files from a computer connected to the Internet. The publishing server determines whether any image files are missing before publication of the image to the Internet. The publishing server stores the image and associated files, and assigns a URL to them in order to be accessible over the Internet. Furthermore, the system provides a way for a user to modify and add images, and manage sub-users and image directories.
